

RISER

Hydrant Unit

WILLIAMS

Our reputation is spreading

The 'Riser' Hydrants are new to the Williams Product Range. The Riser Hydrant design is nothing new to the market, but with our experienced installation team installing many different brands, we soon discovered the advantages and disadvantages of each of the hydrants. We thought why don't we build a hydrant using all the benefits from other brands, plus adding our own touch to the design.

FEATURES

Simple to install	Just the best
Sizing to suit Poly and PVC pipe of common sizes	NZ Designed and Manufactured
Totally hot-dipped galvanised	Neat and tidy, easy to use
Completely built in-house	Built to last
Built to last	Cost effective

Williams' Riser Hydrant

WHY ARE THE WILLIAMS 'RISERS' BETTER THAN THE REST?

NO CLAMPS! - Clamps loosen over time and then start leaking. Instead, we use pressure sealing seals. We have used these seals in our Zero Loss Hydrants for over 20 years.

Seals don't blow out - The Riser has the seals in the bridge which prevents build-up in the seal and reduces the chance of the seal being blown out.

Easier to assemble - Through installing other brands of hydrants ourselves, we have found measuring while installing is inconvenient. Therefore, we have pressed reference points of our hydrant legs which makes it easy to get the correct leg height.

One spanner or socket to assemble - We have square holes in our hydrant brackets so we can use cup head bolts. That means you only need one spanner instead of two, which gives you a spare hand, making these hydrants easy for one man to install.
